Auctions Plus Helmsman sale

inspection prior to sale day encouraged

All bulls never fed grain or pellets
All bulls vaccinated with 7 in 1 and
Vibrovox

All females vaccinated with 5 in 1 &
Pestiguard

Pestivirus free herd by vaccination
Bulls delivered free to most areas of N.S.W
All Bulls DNA tested, sire identified and free
of any genetic disorders

No bulls were assisted at birth

No foot trimming

See our written guarantee on pages 10-11

Hello and welcome to Stanford Poll Herefords

We must surely count ourselves as lucky in this part of the world having had five good years in a row, season wise. The bulls have done well and are only now receiving some supplementary hay to keep them going til sale day.

The experiment last year of offering registered stud females had the expected result and so they are now offered as commercials only, even though many of them are bred in the stud.

Our sale last year was satisfactory without being brilliant, but by years end we had cleared all our sale and paddock bulls which was satisfying.

Two new Yavenvale sires are represented in this years catalogue, Ripper R510 (sold for \$120,000 in 2022) sire of lot 20, and Red Gum R566 sire of lots 8 and 29. The most exciting lots, in my mind however, are those by Stanford Reformer R057, who sold to Bruce Robins in 2022 for \$11500, semen was retained. They are lots 5, 16, & 22 . We are retaining semen for in herd use of lot 22.

Another sire represented by three very good bulls is Stanford Quilpie Q033 who made a return to stud duties from our commercial herd a couple of years ago. He is sire of lots 24, 26, & 30.

The award for Mr consistency however must go to Stanford Roman R042 who has eight sons in the sale.

Later this year we are expecting our first calves by two New Zealand bulls, Beechwood Kapai 28 by Grassmere Gallant 244 (easily the best AI sire we ever used) and Beechwood In Time , by Allendale Anzac K4. Hard to beat those New Zealand bulls for overall consistency.

Over the past eight months Peter and I have travelled fairly extensively through NSW and Victoria looking at

thousands of cattle. Funnily enough we found what we were looking for at two operations that are very similar to our own. (Yes I refuse to buy over fed bulls , and they have Helmsman sales) We purchased two bulls from Bendoc Park at Delegate last year and expect calves later this year, and two bulls from Valley Vista at Buchan Vic earlier this year. Both studs breed a consistent line of good quality cattle.

During the year the goal posts shifted in relation to Breedplan. They are now putting slightly less emphasis on submitted weights etc. and slightly more emphasis on DNA. As a result some of the 600 day EBV's of our sale bulls rose by up to 30 kg, more or less proving what we have known for years. My suggestion to you is, provided they have all been run as a mob, what you see in the live animal is a far better guide to how he will breed than any number of statistics. Of course EBV's will continue to be useful especially when selecting heifer bulls.

Much has been said of the premium black cattle are making in some markets. If you are a little bit smarter there are many ways to reduce or even eliminate the gap. Selling over the hook to Coles for example they make the same money. Getting your herd EU accredited will be a ticket into many feedlots that pay good rates. There are other farm assurance programs from the likes of JBS, Greenhams and MSA that will make your cattle more desirable to the market.

Of course you are probably only paying half as much for your bulls and on average they are lasting twice as long, so you are actually well in front before you sell them, largely eliminating any gap.

Always remember NOTHING beats Herefords for fertility, Temperament and doing ability, so be proud of them.

Best regards
Michael Rutherford

SALE ARRANGEMENTS

Auctions Plus Helmsman Sale 1:00 pm, Inspection from 10:00 am on sale day or prior to sale day by arrangement.

A rebate of 2% for bulls and 1% for heifers to outside agents introducing buyers prior to the sale and settling within seven days.

Supplementary sheet will be available on sale day.

HELMSMAN SALE Online only

AUCTIONS PLUS terms and conditions apply
www.auctionsplus.com.au

1. All lots are on the market simultaneously.
2. You may bid on any lot or lots at any time during the sale.
3. Each lot will have a starting price and bidding will commence at that price.
4. Bids for bulls will be \$500 and females \$50.

THE BENEFITS

1. You have more time to consider your bids. You can bid on any lot at any time, no pressure to make that instant decision.
2. You have time to reassess during the sale. If your 1st choice goes beyond your budget, you still have access to any other lot.

Bulls and Females will be yarded on property from 10:00 am

Bidding will be online only

Nutrien Livestock will be in attendance

STANFORD POLL HEREFORDS

The Rutherford and previously Gardiner families have bred registered Poll Hereford cattle since 1957. The Stanford prefix was established in 1974 with a base of Hopetoun and Sandalwood females. The Stanford and Hopetoun Stud's were merged in the mid 1980's. Genetics to have a significant influence since then have come from Wyregal, South Bukalong, Boonah, Wynella, Croft Ambrey, Lachlan Dale, Llandillo, Billillingra, Rotherfield, Oldfield, Wirruna, Yavenvale and NZ bloodlines.

The herd has been performance recorded with breedplan since 1985 with the early adoption of ultra sound scanning. Our herd was awarded a Certificate of Excellence in the NSW Seedstock Producer of the Year competition both times that we participated.

Today we run 300 stud and 400 commercial breeders. We breed cattle entirely for their commercial attributes. We do not show them as we prefer to focus on productive traits. We have been calving heifers at two years of age for over thirty years and any female not joining in six weeks or requiring assistance is culled. Our cattle are selected for Fertility, calving ease, temperament, structural soundness, performance and market suitability and have generations of inbuilt productivity. All our steers currently go to feedlots.

All calves are weighed at birth, weaning, yearling and again at 18 months. They are also scanned for fat depth, eye muscle area, and intramuscular fat percentage. All bulls are measured for scrotal size as yearlings and again before sale.

Although most calves are sired naturally, we have a well established annual A.I. program to trial new bloodlines.

SUCCESS WITH STEERS

Steers from Stanford have performed well above average in the Australian National Field Days Steer Trial comprising both grass and grain feeding. Over three trials our steers have been awarded prizes for 1st, 2nd and 3rd place pen of three carcasses and 1st, 2nd and 4th place for weight gain on grain. Importantly these results were achieved against all breeds and their crosses. Consistency counts.

FERTILITY AND STRUCTURAL SOUNDNESS

This should be your most important consideration when selecting bulls. Our sale bulls have been inspected by Blayney Veterinary clinic. This included feet, legs, eyes, jaws, testes, sheath, and penis. A service test is not included as it can no longer be justified. Of course we still guarantee them of capable of doing the job.'

Our bulls are entirely pasture reared as this has proven to extend working life in your herd by up to two years over grain fed bulls, according to work done by Dr Mike Blockey. We believe that your grass fed bulls shouldn't reach maximum mature weight before four years of age. If your bull only weighs 700kg at 2 years, relax, as long as he is fit and healthy you are well on the way to owning a very profitable bull as he is likely to last longer than a heavier bull.

DNA / POLL / HORN STATUS

All bulls have been DNA tested

Bulls with (PP) in the lot heading are pure poll.

Bulls with (P) or (S) in the lot heading are heterozygous poll.

No bulls carry any recognised genetic disorder, EBV accuracy is enhanced, and parentage is confirmed.

BREEDPLAN EBV's

Group Breedplan provides an ESTIMATE ! of production traits available to industry across herds.

Comparing actual wts or scans from different herds is almost meaningless as most of the differences will be caused by environmental factors. The EBV's in this catalogue have been compiled by ABRI from data supplied by breeders. Neither ABRI or Herefords Australia oversee or audit the collection of this data. It therefore remains an ESTIMATE. If it doesn't look right then it probably isn't.

CALVING EASE EBV's are based on birth weight and calving ease recorded at birth. They will range from about -20 to +20 with the more positive EBV 's indicating easier calving. Use these when selecting heifer bulls.

BIRTH WEIGHT EBV's may be used to advantage in reducing calving problems in your heifers; the lower figures being more desirable. These should be used in association with such physical characteristics as smooth shoulders and finer bone. Ask us about Heifer bulls, a percentage of our bulls are now bred specifically for heifer joining, and we can advise you on the most likely prospects.

MILK Breedplan is able to split pre weaning performance into growth and milk genes. The EBV for milk in a bull represents the potential for him to pass on milking ability to his daughters. More milk in your cows can help you produce heavier, sappier vealers or reach market weight sooner. Too much milk however, can lead to more dry cows in a bad year, higher rates of udder breakdown in a good year, and more grass tetany problems.

GROWTH 200, 400 & 600 day growth EBV's are a measure of an animals inherent ability to grow to weaning, yearling and older weights, providing feed is available. More growth can help you reach target weights sooner or sell heavier cattle at the same age, however you may also find them harder to finish at younger ages. Larger breeding

cows also require more feed than more moderate cows.

CARCASS

Rump fat EBV's expressed in mm, and eye muscle area EBV's expressed in square cm are derived from ultrasound scanning conducted on all yearlings. Visual muscle score will also prove useful. More muscular carcasses with the right amount of fat cover achieve significant premiums in the market place, currently about 20 cents / kg for each increase of one visual muscle score. Note, visual muscle score is a better indicator of carcass yield than EBV's.

IMF (Intramuscular Fat) % EBV is the estimate of the genetic difference in the percentage of IMF at the 12/13th rib on a 300kg carcass - more positive values would be favourable for the Japanese market, and for meat quality in general.

AN IMPORTANT MESSAGE ABOUT GROWTH

On most properties with standard or higher stocking rates the main limiting factor for cattle growth rates is either feed availability (usually autumn and winter) or feed quality (summer and autumn) , assuming parasites have been controlled. This leaves only 3 to 4 months of each year when cattle can grow to their potential. For the remaining 8 months of each year they can only grow as fast as the limited quantity / quality of feed will allow – **No matter what their potential growth rate is.**

You will also find that the greater the gap between their potential growth rate and that allowed by the limited quantity / quality of feed, then the leaner the animal will become when put under stress such as calf rearing / cold winters etc.

This has serious implications for your breeding herd which on most farms will consume 70 to 80 % of feed grown for the cattle enterprise. If the growth potential of your herd exceeds the feed base provided to it by too much then **leanness becomes a problem for 8 months of the year and herd fertility will suffer.** The effect will be greatest on your heifers calving at 2 years.

You then have two choices

1. Reduce your stocking rate substantially. (ouch.) or
2. Try to match the cattle more closely to the environment.

Let's face it ; to be serious in cattle breeding these days you really have to be calving at 2 years in spring and you have to be thinking in terms of Kg / Ha , not Kg / head.

If you think you can identify with this message then you will realize that bigger is not necessarily better when it comes to growth EBV's. There are no free lunches, bigger cattle need more feed.

Before Breedplan we used to call it constitution or doing ability or in another way, early / late maturity patterns. What is the point in having 700 kg steers that still aren't finished. Their sisters will really struggle as they won't carry enough fat.

In our commercial operation we find that all the higher priced markets available to us can be adequately supplied using moderate growth bulls whilst also keeping cow size sensible.

| Breed avg. EBVs for 2023 Born Calves | | | | | | | | | | |
|--------------------------------------|------|------|------|------|------|------|------|------|------|------|
| | CE | BW | 200g | 400G | 600G | Milk | SS | EMA | Rump | IMF |
| EBV | +4.3 | +3.7 | +35 | +59 | +82 | +18 | +2.3 | +4.4 | +1.3 | +0.8 |

YOUR GUARANTEE
NOW COMES IN TWO PARTS

PART 1

Fertility

(valid for 12 months following purchase)

We guarantee that our bulls are capable (excluding injury or disease occurring after purchase, and assuming you have kept him in good working condition) of achieving conception rates of 90% (85% for autumn and early winter calving herds) when mated to up to 50 females for nine weeks, providing your cows are healthy and cycling. If your bull does not produce the expected number of calves or pregnancies as a result of the failure of his own fertility (Vet. certificate required), we will:

- replace him with a bull of equal value at no charge.
- Give you a credit to the tune of \$50 for each empty cow (up to the guaranteed level).

PART 2

Structural soundness (valid for 2 years following purchase)

The average working life of a bull in south eastern Australia is three years. While we make every endeavor to ensure that all bulls sold are sound, it is often difficult to foresee how a young bulls feet, hips etc. will perform in the years ahead.

We are prepared to guarantee that you will get at least the average three seasons from our bulls and it works like this:

Assuming your bull completes his first mating successfully, but presents in an unsound condition for his 2nd (due to feet, leg or hip problems not caused by injury or disease) we will provide you with a bull of equal value at a 60% discount. If at the end of 2 years your bull, having completed 2 successful matings, presents in an unsound condition prior to his 3rd mating, we will provide you with a bull of equal value at a 30% discount, thus ensuring that you receive the full value of your original purchase.

Remember, if for any reason you are disappointed with your purchase, please let us know, and we will do our best to help. With this type of feedback, you can help us to produce a better article
